PROJECT AND TEAM INFORMATION

Project Title

InternMatch: A Real-Time Internship Recommendation System using DSA and OOP

Team Name: TechTriad Team #	DSCPP-III-2026-T024
Team member 1 (Team Lead) (Last Name: Rana, name: Jigyasa student ID: 2510380058 email: ranajigyasa15@gmail.com)	Rana, Jigyasa – 2510380058 ranajigyasa15@gmail.com 
Team member 2 (Last Name: Singh, name: Masoom student ID: 2510370548 email: masoomsingh021@gmail.com)	Singh, Masoom – 2510370548 masoomsingh021@gmail.com 
Team member 3 (Last Name: Pandey, name: Kashvi student ID: 2510012207, email: kashvipandey007@gmail.com)	Pandey, Kashvi – 2510012207 kashvipandey007@gmail.com 

PHASE-II PROJECT PROGRESS DESCRIPTION

Project Abstract

- (1) Intern match is a c++ project that help students find internships according to their cgpa, branch and skills. It takes internship details from the arbeitnow job board api and uses them to find opportunities that may be suitable for a student.
- (2) the project checks whether a student meets the internship requirements and compares the required skills with the student skills. it also shows missing skills, calculates a match percentage and ranks internships so students can understand which opportunities are a better fit.

Updated Project Approach and Architecture

- (1) We are using C++ for this project along with OOP concepts and data structures. The internship data is fetched from the arbeitnow api using libcurl, and nlohmann/json is used to read the response received from the API.
- (2) In phase II, we are working on inheritance, linked lists and the matching process. the Student class will inherit from the Person class. The matching part checks cgpa, branch and skills to find suitable internships and arrange them according to their match percentage.

Tasks Completed

Task Completed	Team Member
(1) created the Person class. (2) added inheritance to the Student class. (3) updated the Student.h file. (4) worked on changes in Student.cpp.	Jigyasa Rana
(1) created the node structure. (2) implemented linked list. (3) added insertion operation. (4) added display function.	Masoom Singh
(1) checked internship eligibility. (2) matched student skills. (3) calculated match percentage. (4) ranked internships.	Kashvi Pandey

Challenges/Roadblocks

- (1) Handling data received from the api.
- (2) making the classes work properly with inheritance.
- (3) storing internship details in a linked list.
- (4) checking student eligibility correctly and accurately.
- (5) comparing student skills with internship requirements.
- (6) connecting all different parts of the code.
- (7) testing the system with different input values.

Tasks Pending

Task Pending	Team Member (to complete the task)
checking and updating the Person and Student classes to ensure inheritance works properly.)	Jigyasa Rana
(completing and testing linked list operations for storing and displaying internship details correctly.	Masoom Singh
(testing eligibility checking, skill matching, match percentage calculation, internship sorting, and overall system integration.	Kashvi Pandey

Project Outcome/Deliverables

- (1)'The project aims to make it easier for students to find suitable internships using their profile details and internship requirements. it uses c++ and internship data fetched through the api.
- (2) 'The main features include checking eligibility through cgpa and branch, finding missing skills, calculating match percentage and ranking internships. the complete system will be checked after all the modules are connected.

Progress Overview

- (1)'In phase I, we worked on the basic project flow and fetching internship details from the api. this gave us a starting point for developing the remaining features.
- (2) 'In phase II, the focus is on inheritance, linked lists and internship matching. Work has been divided among the three members, and the next step is to finish the assigned parts, connect them and test the complete program.)

Codebase Information

Repository: <https://github.com/masoomsingh022/InternMatch>

Branch: main

Key commits:

- Initial Student and Internship class implementation with real-time API integration
- Split Student and Internship classes into .h/.cpp files, added getter functions
- Fixed Student.cpp and Internship.cpp implementations

Testing and Validation Status

Test Type	Status (Pass/Fail)	Notes
API integration test	Pass	250 live listings fetched and parsed successfully
Student input/display test	Pass	Verified after inheritance refactor

Deliverables Progress

- (1) 'The api feature for fetching internship details was completed in Phase I. in phase II, we are working on inheritance, linked list implementation, and improving the internship matching process.
- (2) 'We still need to check the matching logic, match percentage, sorting, module integration, and final testing. each task will be marked as completed, in progress, or pending based on the actual work done.)
